10 Questions

Problem Statement

Independent artists lack the label teams and budgets needed to cut through the daily noise of thousands of new track releases.

Too Much Noise

Thousands of tracks drop daily. Just uploading a song is not enough; artists need a structured, multi-week strategic plan to break through.

No Label Team

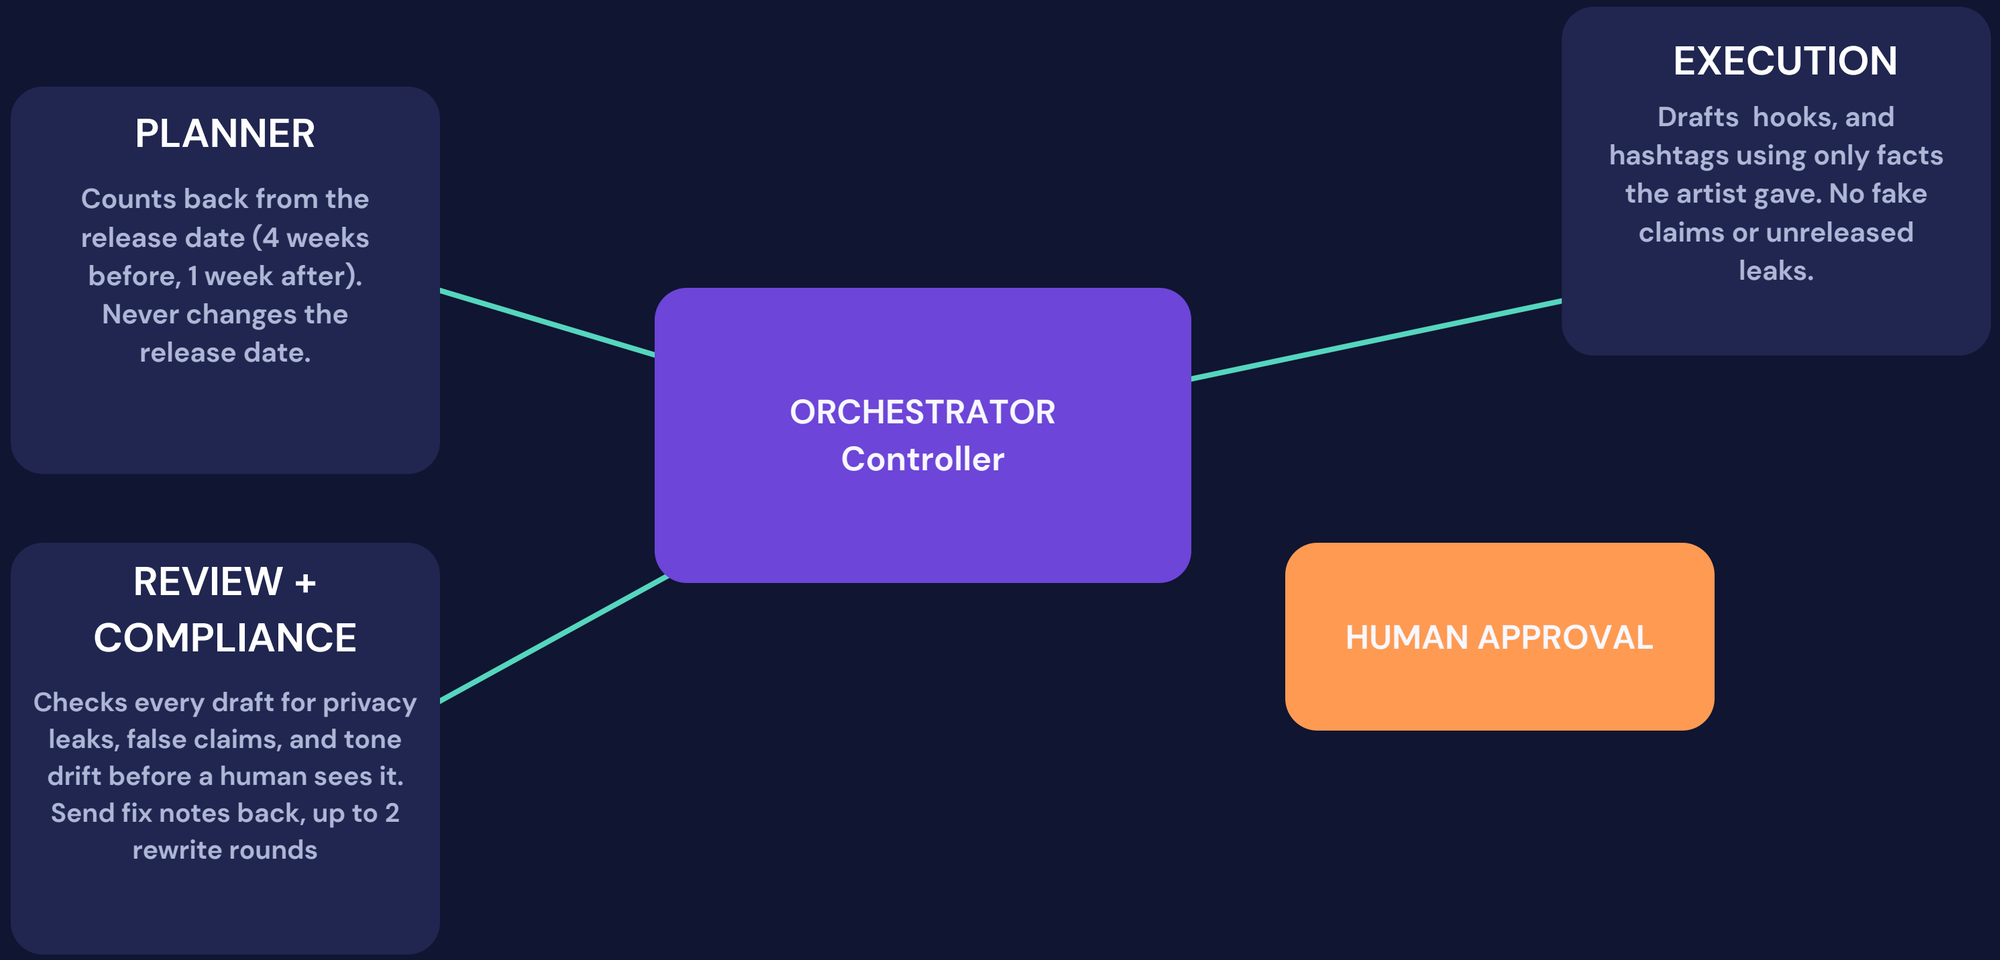

Solo artists have no manager, planner, or marketing team. They have to do everything alone on a tiny budget.

Generic AI Hurts

Normal AI output can introduce wrong dates, fake claims, or leaks. Fans notice and leave.

Our Solution

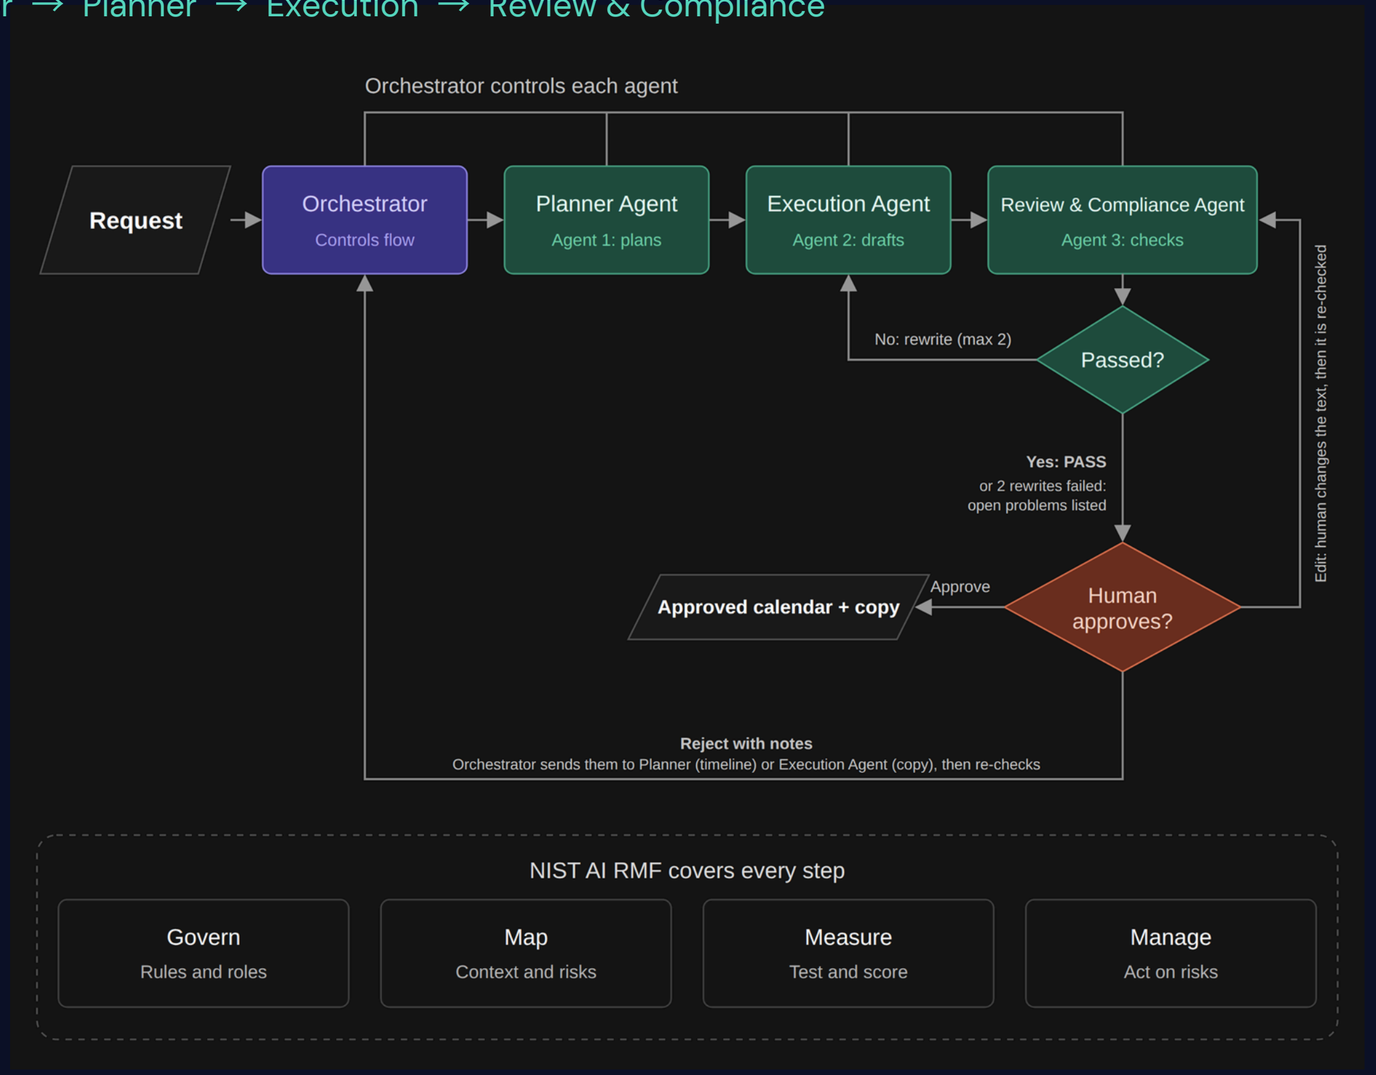

The Comeback Campaigne Engine is an AI-powered campaign engine that automates structured, multi-week release rollouts for independent artists while keeping creators in full control of their final output.

System Diagram and Workflow

A governed path from artist request to campaign-ready output.

Request → Orchestrator → Planner → Execution → Review & Compliance

The 3 Agent Skills

Each specialist is constrained by a dedicated skill file. The Orchestrator adds a controller file.

Orchestrator

- **Description: Routes work, counts rewrite rounds (max 2), logs activity, runs the human approval gate**

01

Planner

skill.md

- **Purpose:** Builds the day-by-day timeline (4 weeks before releas, 1 week after.
- **Inputs:** Artist, Title and Type, Release Date, Vibe and Platforms
- **Output:** Strategic milestone calendar

planner-skill

02

Execution

- **Purpose:** Creates genre-appropriate social copy & hook
- **Inputs:** Timeline, artist inputs, reviewer notes(rewrites)
- **Output:** Hook, caption, 3-5 hashtags per milestone and platform

execution-skill.md

03

Review + Compliance

- **Purpose**: Audits drafts for facts, tone, privacy, and platform rules
- **Inputs:** Draft posts, timeline, artist inputs
- **Output:** PASS/FIX results with clear fix note

review-compliance-skill.md

Hand-offs via the Orchestrator

How the agents hand off work through the Orchestrator.

Skill-to-Skill Flow

- Planner → Orchestrator → Execution: timeline checked, then passed on.
- Execution → Orchestrator → Review & Compliance: drafts sent for checking.
- Review & Compliance → Orchestrator → Execution: fix notes (max 2 rounds).

Orchestrator Skill Control

- Governed by SKILLS/ orchestrator/SKILL.md using prompt rules.
- Routes all work between the agents and counts rewrite rounds (max 2).
- Sends the timeline, drafts, and review result to the human for approval before any export.

Live Demo Walkthrough

NIST AI RMF Integration

The risk framework is embedded across the campaign lifecycle—not added at the end.

GOVERN

- **Skill Rules:** System behavior governed entirely by markdown skill constraints in SKILLS/.
- **Ownership:** The artist retains 100% ownership and final sign-off authority.
- **Enforcement:** Orchestrator skill enforces task routing, rewrite limit, and approval gate.

MAP

- **Users:** Independent artists and management teams.
- Target Audience: Music fans across multi-platform social channels.
- **Context & Data:** Release dates, milestone schedules, genre-appropriate copy, verified facts.
- **Out of Scope:** Direct automated publishing without explicit human sign-off.

MEASURE

- **Audits:** Review & Compliance skill checks drafts, dates, tone, privacy, and platform rules.
- **Iteration Capping:** Maximum 2 revision rounds permitted before escalating to the human.
- **Fact Verification:** Flags any claim the artist did not provide (e.g., false sales ranks or fake links).

MANAGE

- **Human Gate:** Direct human approval required before any campaign asset export.
- **Activity Logging:** Centralized trace log records all inter-skill communication and decisions.
- **Fail-Safe:** After 2 failed rewrites, the Orchestrator sends the open problems to the human.

Top Risks and Governance Rules

Identify broadly. Constrain decisively.

5 RISKS IDENTIFIED

- **Hallucinated Hype Claims:** Verified by Review & Compliance skill.
- **Uncontrolled Infinite Loops:** Capped at 2 revision rounds by Orchestrator.
- **Autonomous Overreach:** Human Approval Gate prevents unvetted exports.
- **Brand Voice Mismatch:** Reviewer checks the tone against the vibe the artist gave.
- **Data Privacy Violations:** Strict markdown guardrails restrict private data.

8 GOVERNANCE RULES

- No Direct Publishing: Artist retains 100% sign-off control.
- No Personal/Private Data: Strictly public artist & rollout data.
- Factual Evidence Required: All campaign dates & claims verified.
- Brand Alignment: Tone matches the vibe the artist gave.
- Transparent Log Traces: Log every message, state, and decision.
- Maximum 2 Revisions: Revision loop capped to prevent stalls.
- Stop on Missing Input: Ask the human, never guess.
- Approved Message Routes Only: Strict Orchestrator control.

Testing and Human Approval

Automation earns confidence through checks. Release still requires a person.

- 6 governed test passed (dry-run against each skill's rules, dates verified with a date tool)
- Handles bad input: missing info, past release date, short runway
- Catches false claims: "award-winning" and "10M streams" flagged, max 2 rewrites
- Protects private content: lyrics and unreleased track names declined
- Refuses shortcuts: "skip the review" request denied

HUMAN APPROVAL GATE

- **Approve: export the calendar and copy**
- **Reject with notes: back to Planner or Execution, then re-review**
- **Edit: human changes text directly, then re-review**
- **No auto-approve, no auto-posting, every step logged**

What we built—and why it matters

A practical comeback engine that scales capability without giving up control.

COORDINATED

Three specialist agents, one Orchestrator.

GOVERNED

Risk checks and evidence at every hand-off.

HUMAN-LED

The artist owns the final decision.

More campaign capacity. Less unmanaged AI risk.

Thank you!
